and Erdenesan Eldev-Ochir*

## **1. Introduction**

This document describes the steps behind the creation of the first Input-Output (I-O) table of Mongolia for the Global Trade Analysis Project (GTAP)<sup>1</sup>. The GTAP I-O table for Mongolia is based on the Mongolian Inter-Sector balance table for 2005 constructed by the National Statistical Office of Mongolia (NSO).

## **2. Source Data**

The data used to construct the Mongolian I-O table in GTAP are based on an I-O table constructed by the National Statistical Office of Mongolia. The 55 sector Mongolian I-O table has a commodity by industry format, with units in millions of local currency (tugrugs) at producers' prices for the year 2005. The 55 sectors are listed in Table A.1 in the appendix.

The original I-O table contained the following data arrays:

- A commodity-by-commodity MAKE matrix
- A vector of the usage of labour and capital
- A vector of indirect taxes on production
- A vector of taxes on products
- A vector of private consumption
- A vector of public consumption
- A vector of consumption by NGOs
- A vector of capital accumulation
- A vector of net change in precious items
- A vector of net change in working capital
- A vector of exports
- A vector of imports

Other unpublished data from the National Statistical Office of Mongolia were used to make adjustments to the I-O table when necessary.

---

<sup>1</sup> This work was funded by BAEconomics Pty Ltd and completed in conjunction with the School of Economic Studies at the National University of Mongolia.

### 3. *Preparing the GTAP Mongolian I-O Table*

The original I-O table was taken to be an official representation of the Mongolian economy. As such, only minor adjustments were made to suit GTAP's requirements:

- The vector of private consumption was combined with the vector of consumption by NGOs and labeled private consumption.
- The vector of net change in precious items was combined with the vector of net change in working capital and labeled change in inventories
- The value of imports was greater than the value of domestic use for the following sectors from Table 1 in the appendix, thus indicating the presence of re-exports.
  - Clothing and Fur processing
  - Coke, liquid and nuclear fuel
  - Machinery equipment production
  - Other transportation products
  - Secondary raw materials
  - Transport and tourism services activities
- Re-exports were removed from the table by adjusting the value of imports and exports down by the same amount so as to maintain the balance of the table.
- The use of land by agricultural industries was missing from the original I-O table.
  - In GTAP 7 (Badri and Walmsley 2008), within the aggregate crop and livestock sectors in Kazakhstan, land accounts for approximately 30 per cent of total value added.
  - The agriculture sectors in Kazakhstan were considered by the authors to be an appropriate proxy for the Mongolian agriculture sectors
  - Thus, 30 per cent of total value added was allocated to the land primary factor in crops and animal husbandry
- The share of labour by the animal husbandry industry in the original I-O table in total value added was approximately 4 per cent. Likewise, the share of labour in the crop industry in the original I-O table in total value added was approximately 14 per cent.
  - Even though the table contains self-employment income, the authors considered these shares to be very low.
  - Furthermore, the implied average wage rate in the crop and animal husbandry sector was calculated from the table using unpublished data from the NSO on the number of people employed in each sector. This was found to be much lower than the reported average wage rate for the industry (also sourced from unpublished data from the NSO).
  - The authors adjusted the payments to labour in the table such that they were approximately equal to that implied by the number of people employed in each sector times the reported average wage rate for the sector.
  - The payments to capital were then adjusted down such that the sum of value added was equal to the sum of value added in the original I-O table.
- The vector of taxes on products was split into three vectors (one for taxes on domestic use, one for taxes on imported use and one for import tariffs) using unpublished data from the NSO.

After making the adjustments described above, the authors then used the programs described within Horridge *et al.* (2008) and the GEMPACK economic modelling software (Harrison and Pearson 1996) to prepare the GTAP Mongolian I-O table.

The 55 sectors in the original I-O table were aggregated to 34 sectors in the GTAP Mongolian I-O table (Table 1 in the appendix). The mapping used is in Table 1 in the appendix. The mapping between the 34 sectors and the 57 GTAP sectors is also in Table 1. No sectors were disaggregated.

## **4. Data Quality**

The NSO estimates the size of the informal economy in Mongolia to be approximately 10 per cent of GDP. The authors note that there is significant variation in estimates from other sources.
